## TEST RESULT CERTIFICATION

**Applicant's name** ..... SUPERDIGITAL TECHNOLOGY CO., LIMITED.  
**Address** ..... F19, Block B, Nanxian Building, Longhua New District, Shenzhen 518000  
 China.

**Manufacture's Name**..... SUPERDIGITAL TECHNOLOGY CO., LIMITED.  
**Address** ..... F19, Block B, Nanxian Building, Longhua New District, Shenzhen 518000  
 China.

### Product description

**Product name** ..... Mobile phone  
**Trademark** ..... Superinworld  
**Model and/or type** ..... SUPER  
**reference** .....  
**Serial Model**..... N/A

**Standards** ..... FCC 47 CFR Part 2(2.1093)  
 ANSI/IEEE C95.1-1992  
 IEEE Std 1528-2003  
 Published RF exposure KDB procedures

This device described above has been tested by Shenzhen NTEK. In accordance with the measurement methods and procedures specified in IEEE Std 1528-2003 and KDB 865664 D01. Testing has shown that this device is capable of compliance with localized specific absorption rate (SAR) specified in FCC 47 CFR Part 2(2.1093) and ANSI/IEEE C95.1-1992. The test results in this report apply only to the tested sample of the stated device/equipment. Other similar device/equipment will not necessarily produce the same results due to production tolerance and measurement uncertainties.

This report shall not be reproduced except in full, without the written approval of Shenzhen NTEK, this document may be altered or revised by Shenzhen NTEK, personal only, and shall be noted in the revision of the document.

### Date of Test

**Date (s) of performance of tests** ..... Aug 10, 2015 ~ Aug 12, 2015  
**Date of Issue**..... Aug 17, 2015  
**Test Result**..... **Pass**

**Testing Engineer** : Cheng Jiawen  
 (Cheng Jiawen)

**Technical Manager** : Brown Lu  
 (Brown Lu)

**Authorized Signatory** : Sam. Chen  
 (Sam Chen)

## 1. General Information

### 1.1. RF exposure limits

(A).Limits for Occupational/Controlled Exposure (W/kg)

| Whole-Body | Partial-Body | Hands, Wrists, Feet and Ankles |
|------------|--------------|--------------------------------|
| 0.4        | 8.0          | 20.0                           |

(B).Limits for General Population/Uncontrolled Exposure (W/kg)

| Whole-Body | Partial-Body | Hands, Wrists, Feet and Ankles |
|------------|--------------|--------------------------------|
| 0.08       | 1.6          | 4.0                            |

NOTE: **Whole-Body SAR** is averaged over the entire body, **partial-body SAR** is averaged over any 1 gram of tissue defined as a tissue volume in the shape of a cube. **SAR for hands, wrists, feet and ankles** is averaged over any 10 grams of tissue defined as a tissue volume in the shape of a cube.

#### Occupational/Controlled Environments:

Are defined as locations where there is exposure that may be incurred by people who are aware of the potential for exposure, (i.e. as a result of employment or occupation).

#### General Population/Uncontrolled Environments:

Are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure.

NOTE  
HEAD AND TRUNK LIMIT  
1.6 W/kg  
APPLIED TO THIS EUT

## 1.2. Statement of Compliance

The maximum results of Specific Absorption Rate (SAR) found during testing for W4301 are as follows.

| Band         | Max Reported SAR(W/kg) |                     |                    | Max. SAR Summation |
|--------------|------------------------|---------------------|--------------------|--------------------|
|              | 1-g Head               | 1-g Body-worn(10mm) | 1-g Hotspot (10mm) |                    |
| GSM 850      | 0.557                  | 1.182               | 1.182              | 1.345              |
| GSM 1900     | 0.787                  | 1.198               | 1.198              |                    |
| UMTS Band V  | 0.534                  | 1.017               | 1.017              |                    |
| UMTS Band II | 1.127                  | 1.090               | 1.090              |                    |
| WiFi 2.4G    | 0.068                  | 0.147               | 0.147              |                    |

This device is in compliance with Specific Absorption Rate (SAR) for general population/uncontrolled exposure limits (1.6 W/kg) specified in FCC 47 CFR Part 2(2.1093) and ANSI/IEEE C95.1-1992, and had been tested in accordance with the measurement methods and procedures specified in EN IEEE Std 1528-2003 & KDB 865664 D01.

|---------------------|-------------|
| Ambient temperature | 20°C – 24°C |
| Relative Humidity   | 30% – 70%   |

### 2.1. SATIMO SAR Measurement Set-up Diagram

These measurements were performed with the automated near-field scanning system OPENSAR from SATIMO. The system is based on a high precision robot (working range: 901 mm), which positions the probes with a positional repeatability of better than  $\pm 0.03$  mm. The SAR measurements were conducted with dosimetric probe (manufactured by SATIMO), designed in the classical triangular configuration and optimized for dosimetric evaluation.

The first step of the field measurement is the evaluation of the voltages induced on the probe by the device under test. Probe diode detectors are nonlinear. Below the diode compression point, the output voltage is proportional to the square of the applied E-field; above the diode compression point, it is linear to the applied E-field. The compression point depends on the diode, and a calibration procedure is necessary for each sensor of the probe.

The Keithley multimeter reads the voltage of each sensor and send these three values to the PC. The corresponding E field value is calculated using the probe calibration factors, which are stored in the working directory. This evaluation includes linearization of the diode characteristics. The field calculation is done separately for each sensor. Each component of the E field is displayed on the "Dipole Area Scan Interface" and the total E field is displayed on the "3D Interface"

## 2.2. Robot

The SATIMO SAR system uses the high precision robots from KUKA. For the 6-axis controller system, the robot controller version (KUKA) from KUKA is used. The KUKA robot series have many features that are important for our application:

- High precision (repeatability  $\pm 0.03$  mm)
- High reliability (industrial design)
- Jerk-free straight movements
- Low ELF interference (the closed metallic construction shields against motor control fields)

## 2.3. E-Field Probe

This E-field detection probe is composed of three orthogonal dipoles linked to special Schottky diodes with low detection thresholds. The probe allows the measurement of electric fields in liquids such as the one defined in the IEEE and CENELEC standards.

For the measurements the Specific Dosimetric E-Field Probe SN 07/15 EP 247 with following specifications is used

- Dynamic range: 0.01-100 W/kg
- Tip Diameter : 5 mm
- Distance between probe tip and sensor center: 2.7 mm
- Distance between sensor center and the inner phantom surface: 4 mm (repeatability better than  $\pm 1$  mm).
- Probe linearity:  $\pm 0.05$  dB
- Axial isotropy:  $< 0.25$  dB
- Hemispherical Isotropy:  $< 0.50$  dB
- Calibration range: 450MHz to 2600MHz for head & body simulating liquid.
- Lower detection limit: 8mW/kg

Angle between probe axis (evaluation axis) and surface normal line: less than  $30^\circ$ .

### 2.3.1. E-Field Probe Calibration

Each probe needs to be calibrated according to a dosimetric assessment procedure with accuracy better than  $\pm 10\%$ . The spherical isotropy shall be evaluated and within  $\pm 0.25$ dB. The sensitivity parameters (Norm X, Norm Y, and Norm Z), the diode compression parameter (DCP) and the conversion factor (Conv F) of the probe are tested. The calibration data can be referred to appendix D of this report.

## 2.4. SAM phantoms

Photo of SAM phantom SN 16/15 SAM119

The SAM phantom is used to measure the SAR relative to people exposed to electro-magnetic field radiated by mobile phones.

### 2.4.1. Technical Data

| Serial Number      | Shell thickness   | Filling volume | Dimensions                                      | Positionner Material    | Permittivity | Loss Tangent |
|--------------------|-------------------|----------------|---|-------------------------|--------------|--------------|
| SN 16/15<br>SAM119 | 2 mm $\pm$ 0.2 mm | 27 liters      | Length:1000 mm<br>Width:500 mm<br>Height:200 mm | Gelcoat with fiberglass | 3.4          | 0.02         |

| Serial Number   | Left Head |      | Right Head |      | Flat Part |      |
|-----------------|-----------|------|------------|------|-----------|------|
| SN 16/15 SAM119 | 2         | 2.02 | 2          | 2.08 | 1         | 2.09 |
|                 | 3         | 2.05 | 3          | 2.06 | 2         | 2.06 |

|                 | 5         | 2.08 | 5          | 2.08 | 4         | 2.10 |
|                 | 6         | 2.05 | 6          | 2.07 | 5         | 2.10 |
|                 | 7         | 2.05 | 7          | 2.05 | 6         | 2.07 |
|                 | 8         | 2.07 | 8          | 2.06 | 7         | 2.07 |
|                 | 9         | 2.08 | 9          | 2.06 | -         | -    |

The test, based on ultrasonic system, allows measuring the thickness with an accuracy of 10 µm.

## 2.5. Device Holder

The positioning system allows obtaining cheek and tilting position with a very good accuracy. In compliance with CENELEC, the tilt angle uncertainty is lower than 1 degree.

| Serial Number   | Holder Material | Permittivity | Loss Tangent |
|-----------------|-----------------|--------------|--------------|
| SN 16/15 MSH100 | Delrin          | 3.7          | 0.005        |

## 2.6. Test Equipment List

This table gives a complete overview of the SAR measurement equipment.

Devices used during the test described are marked ☒

|                                     | Manufacturer | Name of Equipment                    | Type/Model | Serial Number             | Calibration  |              |
|-------------------------------------|--------------|--------------------------------------|------------|---------------------------|--------------|--------------|
|                                     |              |                                      |            |                           | Last Cal.    | Due Date     |

### 3. SAR Measurement Procedures

The measurement procedures are as follows:

#### <Conducted power measurement>

- (a) For WWAN power measurement, use base station simulator to configure EUT WWAN transmission in conducted connection with RF cable, at maximum power in each supported wireless interface and frequency band.
- (b) Read the WWAN RF power level from the base station simulator.
- (c) For WiFi/BT power measurement, use engineering software to configure EUT WiFi/BT continuously transmission, at maximum RF power in each supported wireless interface and frequency band.
- (d) Connect EUT RF port through RF cable to the power meter, and measure WiFi/BT output power.

#### <SAR measurement>

- (a) Use base station simulator to configure EUT WWAN transmission in radiated connection, and engineering software to configure EUT WiFi/BT continuously transmission, at maximum RF power, in the highest power channel.
- (b) Place the EUT in the positions as Appendix A demonstrates.
- (c) Set scan area, grid size and other setting on the OPENSAR software.
- (d) Measure SAR results for the highest power channel on each testing position.
- (e) Find out the largest SAR result on these testing positions of each band.
- (f) Measure SAR results for other channels in worst SAR testing position if the reported SAR of highest power channel is larger than 0.8 W/kg.

According to the test standard, the recommended procedure for assessing the peak spatial-average SAR value consists of the following steps:

- (a) Power reference measurement
- (b) Area scan
- (c) Zoom scan
- (d) Power drift measurement

#### 3.1. Power Reference

The Power Reference Measurement and Power Drift Measurements are for monitoring the power drift of the device under test in the batch process. The minimum distance of probe sensors to surface determines the closest measurement point to phantom surface. This distance cannot be smaller than the distance of sensor calibration points to probe tip as defined in the probe properties.

#### 3.2. Area scan & Zoom scan

The area scan is a 2D scan to find the hot spot location on the DUT. The zoom scan is a 3D scan above the hot spot to calculate the 1g and 10g SAR value.

Measurement of the SAR distribution with a grid of 8 to 16 mm \* 8 to 16 mm and a constant distance to

the inner surface of the phantom. Since the sensors cannot directly measure at the inner phantom surface, the values between the sensors and the inner phantom surface are extrapolated. With these values the area of the maximum SAR is calculated by an interpolation scheme. Around this point, a cube of 30 \* 30 \* 30 mm or 32 \* 32 \* 32 mm is assessed by measuring 5 or 8 \* 5 or 8 \* 4 or 5 mm. With these data, the peak spatial-average SAR value can be calculated.

From the scanned SAR distribution, identify the position of the maximum SAR value, in addition identify the positions of any local maxima with SAR values within 2 dB of the maximum value that will not be within the zoom scan of other peaks; additional peaks shall be measured only when the primary peak is within 2 dB of the SAR compliance limit (e.g., 1 W/kg for 1,6 W/kg 1 g limit, or 1,26 W/kg for 2 W/kg, 10 g limit).

Area scan & Zoom scan scan parameters extracted from FCC KDB 865664 D01 SAR measurement 100 MHz to 6 GHz.

|  |                                    |  | $\leq 3$ GHz   | $> 3$ GHz   |
|--|------------------------------------|--|--|---|
| Maximum distance from closest measurement point (geometric center of probe sensors) to phantom surface |                                    |  | $5 \pm 1$ mm   | $\frac{1}{2} \cdot \delta \cdot \ln(2) \pm 0.5$ mm                            |
| Maximum probe angle from probe axis to phantom surface normal at the measurement location              |                                    |  | $30^\circ \pm 1^\circ$   | $20^\circ \pm 1^\circ$  |
| Maximum area scan spatial resolution: $\Delta x_{Area}$ , $\Delta y_{Area}$                            |                                    |  | $\leq 2$ GHz: $\leq 15$ mm<br>2 – 3 GHz: $\leq 12$ mm  | 3 – 4 GHz: $\leq 12$ mm<br>4 – 6 GHz: $\leq 10$ mm                            |
|  |                                    |  | When the x or y dimension of the test device, in the measurement plane orientation, is smaller than the above, the measurement resolution must be $\leq$ the corresponding x or y dimension of the test device with at least one measurement point on the test device. |   |
| Maximum zoom scan spatial resolution: $\Delta x_{Zoom}$ , $\Delta y_{Zoom}$                            |                                    |  | $\leq 2$ GHz: $\leq 8$ mm<br>2 – 3 GHz: $\leq 5$ mm *  | 3 – 4 GHz: $\leq 5$ mm *<br>4 – 6 GHz: $\leq 4$ mm *                          |
| Maximum zoom scan spatial resolution, normal to phantom surface  | uniform grid: $\Delta z_{Zoom}(n)$ |  | $\leq 5$ mm  | 3 – 4 GHz: $\leq 4$ mm<br>4 – 5 GHz: $\leq 3$ mm<br>5 – 6 GHz: $\leq 2$ mm    |
|  | graded grid                        | $\Delta z_{Zoom}(1)$ : between 1 <sup>st</sup> two points closest to phantom surface | $\leq 4$ mm  | 3 – 4 GHz: $\leq 3$ mm<br>4 – 5 GHz: $\leq 2.5$ mm<br>5 – 6 GHz: $\leq 2$ mm  |
|  |                                    | $\Delta z_{Zoom}(n>1)$ : between subsequent points                                   | $\leq 1.5 \cdot \Delta z_{Zoom}(n-1)$  |   |
| Minimum zoom scan volume   | x, y, z                            |  | $\geq 30$ mm   | 3 – 4 GHz: $\geq 28$ mm<br>4 – 5 GHz: $\geq 25$ mm<br>5 – 6 GHz: $\geq 22$ mm |

Note:  $\delta$  is the penetration depth of a plane-wave at normal incidence to the tissue medium; see draft standard IEEE P1528-2011 for details.

\* When zoom scan is required and the *reported* SAR from the *area scan based 1-g SAR estimation* procedures of KDB 447498 is  $\leq 1.4$  W/kg,  $\leq 8$  mm,  $\leq 7$  mm and  $\leq 5$  mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.

### **3.3. Description of interpolation/extrapolation scheme**

The local SAR inside the phantom is measured using small dipole sensing elements inside a probe body. The probe tip must not be in contact with the phantom surface in order to minimise measurements errors, but the highest local SAR will occur at the surface of the phantom.

An extrapolation is used to determine this highest local SAR values. The extrapolation is based on a fourth-order least-square polynomial fit of measured data. The local SAR value is then extrapolated from the liquid surface with a 1 mm step.

The measurements have to be performed over a limited time (due to the duration of the battery) so the step of measurement is high. It could vary between 5 and 8 mm. To obtain an accurate assessment of the maximum SAR averaged over 10 grams and 1 gram requires a very fine resolution in the three dimensional scanned data array.

### **3.4. Volumetric Scan**

The volumetric scan consists to a full 3D scan over a specific area. This 3D scan is useful for multi Tx SAR measurement. Indeed, it is possible with OpenSAR to add, point by point, several volumetric scan to calculate the SAR value of the combined measurement as it is defined in the standard IEEE1528 and IEC62209.

### **3.5. Power Drift**

All SAR testing is under the EUT install full charged battery and transmit maximum output power. In OpenSAR measurement software, the power reference measurement and power drift measurement procedures are used for monitoring the power drift of EUT during SAR test. Both these procedures measure the field at a specified reference position before and after the SAR testing. The software will calculate the field difference in V/m. If the power drifts more than  $\pm 5\%$ , the SAR will be retested.

## 4. System Verification Procedure

### 4.1. Tissue Verification

The following tissue formulations are provided for reference only as some of the parameters have not been thoroughly verified. The composition of ingredients may be modified accordingly to achieve the desired target tissue parameters required for routine SAR evaluation.

| Ingredients (% of weight) | Head Tissue |       |       |       |       |       |       |       |
|---------------------------|-------------|-------|-------|-------|-------|-------|-------|-------|
| Frequency Band (MHz)      | 750         | 835   | 900   | 1800  | 1900  | 2000  | 2450  | 2600  |
| Water                     | 34.40       | 34.40 | 34.40 | 55.36 | 55.36 | 71.88 | 71.88 | 71.88 |
| NaCl                      | 0.79        | 0.79  | 0.79  | 0.35  | 0.35  | 0.16  | 0.16  | 0.16  |
| 1,2-Propanediol           | 64.81       | 64.81 | 64.81 | 0.00  | 0.00  | 0.00  | 0.00  | 0.00  |
| Triton X-100              | 0.00        | 0.00  | 0.00  | 30.45 | 30.45 | 19.97 | 19.97 | 19.97 |
| DGBE                      | 0.00        | 0.00  | 0.00  | 13.84 | 13.84 | 7.99  | 7.99  | 7.99  |

#### 4.1.1. Tissue Dielectric Parameter Check Results

The simulating liquids should be checked at the beginning of a series of SAR measurements to determine if the dielectric parameters are within the tolerances of the specified target values. The measured conductivity and relative permittivity should be within  $\pm 5\%$  of the target values.

| Tissue Type | Measured Frequency (MHz) | Target Tissue              |                              | Measured Tissue |                | Liquid Temp. | Test Date    |
|-------------|--------------------------|----------------------------|------------------------------|-----------------|----------------|--------------|--------------|
|             |                          | $\epsilon_r$ ( $\pm 5\%$ ) | $\sigma$ (S/m) ( $\pm 5\%$ ) | $\epsilon_r$    | $\sigma$ (S/m) |              |              |
| Head 850    | 835                      | 41.50<br>(39.43~43.57)     | 0.90<br>(0.86~0.94)          | 43.29           | 0.87           | 21.3 °C      | Aug 10, 2015 |
| Body 850    | 835                      | 55.20<br>(52.44~57.96)     | 0.97<br>(0.92~1.01)          | 54.27           | 1.00           | 21.5 °C      | Aug 10, 2015 |
| Head 1900   | 1900                     | 40.00<br>(38.00~42.00)     | 1.40<br>(1.33~1.47)          | 38.54           | 1.42           | 21.4 °C      | Aug 11, 2015 |

NOTE: The dielectric parameters of the tissue-equivalent liquid should be measured under similar ambient conditions and within 2 °C of the conditions expected during the SAR evaluation to satisfy protocol requirements.

## 4.2. System Verification Procedure

The system verification is performed for verifying the accuracy of the complete measurement system and performance of the software. The dipole is connected to the signal source consisting of signal generator and amplifier via a directional coupler, N-connector cable and adaption to SMA. It is fed with a power of 100mW (below 5GHz) or 100mW (above 5GHz). To adjust this power a power meter is used. The power sensor is connected to the cable before the system verification to measure the power at this point and do adjustments at the signal generator. At the outputs of the directional coupler both return loss as well as forward power are controlled during the system verification to make sure that emitted power at the dipole is kept constant. This can also be checked by the power drift measurement after the test (result on plot).

The system verification is shown as below picture:

#### 4.2.1. System Verification Results

Comparing to the original SAR value provided by SATIMO, the verification data should be within its specification of  $\pm 10\%$ . Below table shows the target SAR and measured SAR after normalized to 1W input power. The table below indicates the system performance verification can meet the variation criterion and the plots can be referred to Appendix B of this report.

| System Verification | Target SAR (1W)<br>( $\pm 10\%$ ) |                        | Measured SAR<br>(Normalized to 1W) |             | Liquid Temp. | Test Date    |
|---------------------|-----------------------------------|------------------------|------------------------------------|-------------|--------------|--------------|
|                     | 1-g (W/Kg)                        | 10-g (W/Kg)            | 1-g (W/Kg)                         | 10-g (W/Kg) |              |              |

## 5. SAR Measurement variability and uncertainty

### 5.1. SAR measurement variability

Per KDB865664 D01 SAR measurement 100 MHz to 6 GHz, SAR measurement variability must be assessed for each frequency band, which is determined by the SAR probe calibration point and tissue-equivalent medium used for the device measurements. The additional measurements are repeated after the completion of all measurements requiring the same head or body tissue-equivalent medium in a frequency band. The test device should be returned to ambient conditions (normal room temperature) with the battery fully charged before it is re-mounted on the device holder for the repeated measurement(s) to minimize any unexpected variations in the repeated results.

- 1) Repeated measurement is not required when the original highest measured SAR is  $< 0.80$  W/kg; steps 2) through 4) do not apply.
- 2) When the original highest measured SAR is  $\geq 0.80$  W/kg, repeat that measurement once.
- 3) Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is  $> 1.20$  or when the original or repeated measurement is  $\geq 1.45$  W/kg (~ 10% from the 1-g SAR limit).
- 4) Perform a third repeated measurement only if the original, first or second repeated measurement is  $\geq 1.5$  W/kg and the ratio of largest to smallest SAR for the original, first and second repeated measurements is  $> 1.20$ .

### 5.2. SAR measurement uncertainty

Per KDB865664 D01 SAR Measurement 100 MHz to 6 GHz, when the highest measured 1-g SAR within a frequency band is  $< 1.5$  W/kg, the extensive SAR measurement uncertainty analysis described in IEEE Std 1528-2003 is not required in SAR reports submitted for equipment approval. The equivalent ratio (1.5/1.6) is applied to extremity and occupational exposure conditions.

## 6. RF Exposure Positions

### 6.1. Ear and handset reference point

Figure 6.1.1 shows the front, back, and side views of the SAM phantom. The center-of-mouth reference point is labeled “M”, the left ear reference point (ERP) is marked “LE”, and the right ERP is marked “RE”.

Fig 6.1.1 Front, back, and side views of SAM phantom

### 6.2. Definition of the cheek position

1. Define two imaginary lines on the handset, the vertical centerline and the horizontal line. The vertical centerline passes through two points on the front side of the handset: the midpoint of the width  $w_t$  of the handset at the level of the acoustic output (point A in Figure 6.2.1 and Figure 6.2.2), and the midpoint of the width  $w_b$  of the bottom of the handset (point B). The horizontal line is perpendicular to the vertical centerline and passes through the center of the acoustic output (see Figure 6.2.1). The two lines intersect at point A. Note that for many handsets, point A coincides with the center of the acoustic output; however, the acoustic output may be located elsewhere on the horizontal line. Also note that the vertical centerline is not necessarily parallel to the front face of the handset (see Figure 6.2.2), especially for clamshell handsets, handsets with flip covers, and other irregularly-shaped handsets.
2. Position the handset close to the surface of the phantom such that point A is on the (virtual) extension of the line passing through points RE and LE on the phantom (see Figure 6.2.3), such that the plane defined by the vertical centerline and the horizontal line of the handset is approximately parallel to the sagittal plane of the phantom.
3. Translate the handset towards the phantom along the line passing through RE and LE until handset point A touches the pinna at the ERP
4. While maintaining the handset in this plane, rotate it around the LE-RE line until the vertical centerline is in the plane normal to the plane containing B-M and N-F lines, i.e., the Reference Plane.
5. Rotate the handset around the vertical centerline until the handset (horizontal line) is parallel to the N-F line.

6. While maintaining the vertical centerline in the Reference Plane, keeping point A on the line passing through RE and LE, and maintaining the handset contact with the pinna, rotate the handset about the N-F line until any point on the handset is in contact with a phantom point below the pinna on the cheek. See Figure 6.2.3. The actual rotation angles should be documented in the test report.

Fig 6.2.1 Handset vertical and horizontal reference lines—"fixed case"

Fig 6.2.2 Handset vertical and horizontal reference lines—"clam-shell case"

Fig 6.2.3 cheek or touch position. The reference points for the right ear (RE), left ear (LE), and mouth (M), which establish the Reference Plane for handset positioning, are indicated.

### 6.3. Definition of the tilt position

1. While maintaining the orientation of the handset, retract the handset parallel to the reference plane far enough away from the phantom to enable a rotation of the device by 15 degree.
2. Rotate the Handset around the horizontal line by 15 degree (see Figure 6.3.1).
3. While maintaining the orientation of the handset, move the handset towards the phantom on a line passing through RE and LE until any part of the handset touches the ear. The tilt position is obtained when the contact is on the pinna. If the contact is at any location other than the pinna, e.g., the antenna with the back of the phantom head, the angle of the handset shall be reduced. In this case, the tilt position is obtained if any part of the handset is in contact with the pinna as well as a second part of the handset is in contact with the phantom, e.g., the antenna with the back of the head.

Figure 6.3.1 – Tilt position of the wireless device on the left side of SAM

### 6.4. Body Worn Accessory

1. Body-worn operating configurations are tested with the belt-clips and holsters attached to the device and positioned against a flat phantom in a normal use configuration (see Figure 6.4.1). Per KDB 648474 D04, body-worn accessory exposure is typically related to voice mode operations when handsets are carried in body-worn accessories. The body-worn accessory procedures in FCC KDB 447498 D01 should be used to test for body-worn accessory SAR compliance, without a headset connected to it. This enables the test results for such configuration to be compatible with that required for hotspot mode when the body-worn accessory test separation distance is greater than or equal to that required for hotspot mode, when applicable. When the reported SAR for body-worn accessory, measured without a headset connected to the handset is  $< 1.2 \text{ W/kg}$ , the highest reported SAR configuration for that wireless mode and frequency band should be repeated for that body-worn accessory with a handset attached to the handset.
2. Accessories for body-worn operation configurations are divided into two categories: those that do not contain metallic components and those that do contain metallic components. When multiple accessories that do not contain metallic components are supplied with the device, the device is tested with only the accessory that dictates the closest spacing to the body. Then multiple accessories that contain metallic components are test with the

device with each accessory. If multiple accessories share an identical metallic component (i.e. the same metallic belt-clip used with different holsters with no other metallic components) only the accessory that dictates the closest spacing to the body is tested.

Figure 6.4.1 – Test positions for body-worn devices

## 6.5. Wireless Router Devices

Some battery-operated handsets have the capability to transmit and receive user through simultaneous transmission of WIFI simultaneously with a separate licensed transmitter. The FCC has provided guidance in FCC HDB Publication 941225 D06 where SAR test considerations for handsets ( $L \times W \geq 9 \text{ cm} \times 5 \text{ cm}$ ) are based on a composite test separation distance of 10mm from the front, back and edges of the device containing transmitting antennas within 2.5cm of their edges, determined from general mixed use conditions for this type of devices. Since the hotspot SAR results may overlap with the body-worn accessory SAR requirements, the more conservative configurations can be considered, thus excluding some body-worn accessory SAR tests.

When the user enables the personal wireless router functions for the handset, actual operations include simultaneous transmission of both the WIFI transmitter and another licensed transmitter. Both transmitters often do not transmit at the same transmitting frequency and thus cannot be evaluated for SAR under actual use conditions due to the limitations of the SAR assessment probes. Therefore, SAR must be evaluated for each frequency transmission and mode separately and spatially summed with the WIFI transmitter according to FCC KDB Publication 447498 D01 publication procedures. The “Portable Hotspot” feature on the handset was NOT activated during SAR assessments, to ensure the SAR measurements were evaluated for a single transmission frequency RF signal at a time.

## 7. Conducted RF Output Power

### 7.1. Maximum Tune-up Limit

| Band         | Mode                  | The Tune-up Maximum Power (Customer Declared)(dBm) | Range     | Measured Conduct Maximum Power(dBm) |
|--------------|-----------------------|--|-----------|-------------------------------------|
| GSM 850      | GSM (GMSK)            | 31.5±1   | 30.5~32.5 | 32.25                               |
|              | GPRS(GMSK, 1 Tx slot) | 31.5±1   | 30.5~32.5 | 32.24                               |
|              | GPRS(GMSK, 2 Tx slot) | 30.5±1   | 29.5~31.5 | 31.36                               |
|              | GPRS(GMSK, 3 Tx slot) | 28.5±1   | 27.5~29.5 | 29.47                               |
|              | GPRS(GMSK, 4 Tx slot) | 27.5±1   | 26.5~28.5 | 28.20                               |
|              | EDGE(8PSK, 1 Tx slot) | 27±1   | 26~28     | 27.92                               |
|              | EDGE(8PSK, 2 Tx slot) | 26±1   | 25~27     | 26.83                               |
|              | EDGE(8PSK, 3 Tx slot) | 26±1   | 25~27     | 26.53                               |
|              | EDGE(8PSK, 4 Tx slot) | 26±1   | 25~27     | 26.51                               |
| GSM 1900     | GSM (GMSK)            | 29±1   | 28~30     | 29.85                               |
|              | GPRS(GMSK, 1 Tx slot) | 29±1   | 28~30     | 29.82                               |
|              | GPRS(GMSK, 2 Tx slot) | 28±1   | 27~29     | 28.71                               |
|              | GPRS(GMSK, 3 Tx slot) | 26±1   | 25~27     | 26.48                               |
|              | GPRS(GMSK, 4 Tx slot) | 25±1   | 24~26     | 25.34                               |
|              | EDGE(8PSK, 1 Tx slot) | 24±1   | 23~25     | 24.47                               |
|              | EDGE(8PSK, 2 Tx slot) | 22±1   | 21~23     | 22.81                               |
|              | EDGE(8PSK, 3 Tx slot) | 22±1   | 21~23     | 22.18                               |
|              | EDGE(8PSK, 4 Tx slot) | 22±1   | 21~23     | 22.14                               |
| UMTS Band V  | RMC 12.2Kbps          | 22.5±1   | 21.5~23.5 | 23.23                               |

## 7.2. GSM Conducted Power

- 1) Per KDB 447498 D01, the maximum output power channel is used for SAR testing and for further SAR test reduction.
- 2) Per KDB 941225 D01, considering the possibility of e.g. 3rd party VoIP operation for Head and body-worn SAR test reduction for GSM and GPRS modes is determined by the source-based time-averaged output power including tune-up tolerance. The mode with highest specified time-averaged output power should be tested for SAR compliance in the applicable exposure conditions. For modes with the same specified maximum output power and tolerance, the higher number time-slot configuration should be tested. Therefore, the EUT was set in GPRS (4Tx slots) for GSM850/GSM1900.
- 3) Per KDB 941225 D01, for Hotspot SAR test reduction for GPRS modes is determined by the source-based time-averaged output power including tune-up tolerance, for modes with the same specified maximum output power and tolerance, the higher number time-slot configuration should be tested, therefore, the EUT was set in GPRS (4Tx slots) for GSM850/GSM1900.

| Band GSM850              | Burst-Averaged output Power (dBm) |       |       |       | Frame-Averaged output Power (dBm) |       |       |       |

| EDGE(8PSK, 4 Tx slot) | 23.00                             | 22.06  | 22.14  | 21.97  | 19.99                             | 19.05  | 19.13  | 18.96  |

Note: The frame-averaged power is linearly scaled the maximum burst averaged power over 8 time slots. The calculated method are shown as below:

Frame-averaged power = Maximum burst averaged power (1 Tx Slot) – 9.03 dB

Frame-averaged power = Maximum burst averaged power (2 Tx Slots) – 6.02 dB

Frame-averaged power = Maximum burst averaged power (3 Tx Slots) - 4.26 dB

Frame-averaged power = Maximum burst averaged power (4 Tx Slots) – 3.01 dB

### 7.3. UMTS Conducted Power

The following tests were conducted according to the test requirements outlines in 3GPP TS 34.121 specification. A summary of these settings are illustrated below:

#### 1. Release99 Setup Configuration

|      |         |       |
|------|---------|-------|
| Mode | Subtest | Rel99 |
|------|---------|-------|

|                       |                         |              |
|-----------------------|-------------------------|--------------|
| UMTS General Settings | Loopback Mode           | Test Mode 1  |
|                       | Rel99 RMC               | 12.2kbps RMC |
|                       | Power Control Algorithm | Algorithm2   |
|                       | $\beta_c/\beta_d$       | 8/15         |

## 2. HSDPA Setup Configuration

|                         |                                      |              |       |       |       |
|-------------------------|--------------------------------------|--------------|-------|-------|-------|
|                         | Mode                                 | HSDPA        | HSDPA | HSDPA | HSDPA |
|                         | Subtest                              | 1            | 2     | 3     | 4     |
| UMTS General Settings   | Loopback Mode                        | Test Mode 1  |       |       |       |
|                         | Rel99 RMC                            | 12.2kbps RMC |       |       |       |
|                         | HSDPA FRC                            | H-Set1       |       |       |       |
|                         | Power Control Algorithm              | Algorithm 2  |       |       |       |
|                         | $\beta_c$                            | 2/15         | 12/15 | 15/15 | 15/15 |
|                         | $\beta_d$                            | 15/15        | 15/15 | 8/15  | 4/15  |
|                         | Bd (SF)                              | 64           |       |       |       |
|                         | $\beta_c/\beta_d$                    | 2/15         | 12/15 | 15/8  | 15/4  |
|                         | $\beta_{hs}$                         | 4/15         | 24/15 | 30/15 | 30/15 |
| HSDPA Specific Settings | $D_{ACK}$                            | 8            |       |       |       |
|                         | $D_{NAK}$                            | 8            |       |       |       |
|                         | DCQI                                 | 8            |       |       |       |
|                         | Ack-Nack repetition factor           | 3            |       |       |       |
|                         | CQI Feedback (Table 5.2B.4)          | 4ms          |       |       |       |
|                         | CQI Repetition Factor (Table 5.2B.4) | 2            |       |       |       |
|                         | $A_{hs} = \beta_{hs}/\beta_c$        | 30/15        |       |       |       |

## 3. HSUPA Setup Configuration

|                         |                                      |                |       |                |       |        |
|-------------------------|--------------------------------------|----------------|-------|----------------|-------|--------|

#### 4. UMTS Conducted Power Results

- 1) Per KDB 941225 D01, SAR for Head / Hotspot / Body-worn exposure is measured using a 12.2 kbps RMC with TPC bits configured to all "1's".
- 2) Per KDB 941225 D01, RMC 12.2kbps setting is used to evaluate SAR. If the maximum output power and tune-up tolerance specified for production units in HSDPA / HSUPA is  $\leq \frac{1}{4}$  dB higher than RMC 12.2Kbps or when the highest reported SAR of the RMC12.2Kbps is scaled by the ratio of specified maximum output power and tune-up tolerance of HSDPA / HSUPA to RMC12.2Kbps and the adjusted SAR is  $\leq 1.2$  W/kg, SAR measurement is not required for HSDPA / HSUPA.

| Band            | UMTS Band V  |        |       |        |
|-----------------|--------------|--------|-------|--------|

## 7.4. WiFi & BT Conducted Power

### 7.4.1. Conducted Power Results Of WiFi

For WiFi 2.4G SAR testing, highest average RF output power channel for the lowest data rate for 802.11b were selected for SAR evaluation. 802.11g/n HT20/HT40 were not investigated since the average output powers over all channels and data rates were not more than 0.25 dB higher than the tested channel in the lowest data rate of 802.11b mode.

The output power of WiFi antenna is as following:

| WiFi<br>2450MHz   | Channel | Average Power (dBm) for Data Rates (Mbps) |       |       |       |       |       |       |       |       |
|-------------------|---------|---|-------|-------|-------|-------|-------|-------|-------|-------|
|                   |         | Tune-up                                   | 1     | 2     | 5.5   | 11    | /     | /     | /     | /     |
| 802.11b           | 1       | 13.00                                     | 12.14 | 12.10 | 11.92 | 11.85 | /     | /     | /     | /     |
|                   | 6       | 13.00                                     | 12.11 | 12.03 | 11.94 | 11.90 | /     | /     | /     | /     |
|                   | 11      | 13.00                                     | 12.08 | 11.98 | 11.97 | 11.87 | /     | /     | /     | /     |
| 802.11g           | Channel | Tune-up                                   | 6     | 9     | 12    | 18    | 24    | 36    | 48    | 54    |
|                   | 1       | 12.00                                     | 11.38 | 11.24 | 11.31 | 11.10 | 11.02 | 10.73 | 10.65 | 10.44 |
|                   | 6       | 12.00                                     | 11.42 | 11.28 | 11.20 | 11.26 | 11.08 | 10.96 | 10.50 | 10.54 |

|                   | 11      | 12.00                                     | 11.38 | 11.33 | 11.31 | 11.29 | 11.13 | 10.94 | 10.55 | 10.57 |
| 802.11n<br>(HT40) | Channel | Tune-up                                   | MCS0  | MCS1  | MCS2  | MCS3  | MCS4  | MCS5  | MCS6  | MCS7  |
|                   | 3       | 11.00                                     | 10.12 | 9.89  | 9.84  | 9.91  | 9.81  | 9.50  | 9.26  | 9.25  |
|                   | 6       | 11.00                                     | 10.19 | 10.06 | 10.11 | 10.01 | 9.82  | 9.75  | 9.39  | 9.24  |
|                   | 9       | 11.00                                     | 10.19 | 10.03 | 9.95  | 10.06 | 9.79  | 9.71  | 9.30  | 9.35  |

### 7.4.2. Conducted Power Results Of BT

The output power of BT antenna is as following:

| BT   | Average Conducted Power (dBm) |      |      |      |
|------|-------------------------------|------|------|------|
|      | Tune-up                       | 0CH  | 39CH | 78CH |
| DH5  | 7.00                          | 5.68 | 5.97 | 5.27 |
| 2DH5 | 7.00                          | 4.18 | 5.10 | 4.49 |
| 3DH5 | 7.00                          | 4.68 | 5.23 | 4.70 |

## 8. Antenna Location

| Distance of the Antenna to the EUT surface/edge |            |           |           |            |          |             |
|---|------------|-----------|-----------|------------|----------|-------------|
| Antennas  | Front Side | Back Side | Left Side | Right Side | Top Side | Bottom Side |
| WWAN Main                                       | ≤ 25mm     | ≤ 25mm    | ≤ 25mm    | ≤ 25mm     | >25mm    | ≤ 25mm      |
| WLAN & BT                                       | ≤ 25mm     | ≤ 25mm    | ≤ 25mm    | >25mm      | ≤ 25mm   | >25mm       |

| Positions for SAR tests; Hotspot mode |            |           |           |            |          |             |
|---------------------------------------|------------|-----------|-----------|------------|----------|-------------|
| Antennas                              | Front Side | Back Side | Left Side | Right Side | Top Side | Bottom Side |
| WWAN Main                             | Yes        | Yes       | Yes       | Yes        | NO       | Yes         |
| WLAN & BT                             | Yes        | Yes       | Yes       | NO         | Yes      | NO          |

NOTE: Referring to KDB 941225 D06, when the overall device length and width are  $\geq 9\text{cm} \times 5\text{cm}$ , the test distance is 10mm. SAR must be measured for all sides and surfaces with a transmitting antenna located within 25mm from that surface or edge.

## 9. Stand-alone SAR test exclusion

Per FCC KDB 447498D01, the 1-g SAR and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances  $\leq 50$  mm are determined by:

$[(\text{max. power of channel, including tune-up tolerance, mW})/(\text{min. test separation distance, mm})] \cdot [\sqrt{f_{\text{(GHz)}}}] \leq 3.0$  for 1-g SAR and  $\leq 7.5$  for 10-g extremity SAR, where:

- $f_{\text{(GHz)}}$  is the RF channel transmit frequency in GHz
- Power and distance are rounded to the nearest mW and mm before calculation
- The result is rounded to one decimal place for comparison

When the minimum test separation distance is  $< 5$  mm, a distance of 5 mm is applied to determine SAR test exclusion.

| Mode | $P_{\text{max}}$<br>(dBm) | $P_{\text{max}}$<br>(mW) | Distance<br>(mm) | f<br>(GHz) | Calculation<br>Result | SAR Exclusion<br>threshold | SAR test<br>exclusion |
|------|---------------------------|--------------------------|------------------|------------|-----------------------|----------------------------|-----------------------|
| BT   | 7.00                      | 5.01                     | $<5$             | 2.480      | 1.6                   | 3.0                        | Yes                   |

NOTE: Standalone SAR test exclusion for BT

When standalone SAR test exclusion applies to an antenna that transmits simultaneously with other antennas, the standalone SAR must be estimated according to following to determine simultaneous transmission SAR test exclusion:

$[(\text{max. power of channel, including tune-up tolerance, mW})/(\text{min. test separation distance, mm})] \cdot [\sqrt{f_{\text{(GHz)}}/x}] \text{ W/kg}$  for test separation distances  $\leq 50\text{mm}$ , where  $x = 7.5$  for 1-g SAR and  $x = 18.75$  for 10-g SAR.

When the minimum test separation distance is  $< 5$  mm, a distance of 5 mm is applied to determine SAR test exclusion.

| Mode | Position  | $P_{\text{max}}$<br>(dBm) | $P_{\text{max}}$ (mW) | Distance (mm) | f<br>(GHz) | x   | Estimated SAR (W/Kg) |
|------|-----------|---------------------------|-----------------------|---------------|------------|-----|----------------------|
| BT   | Head      | 5.00                      | 3.16                  | $<5$          | 2.480      | 7.5 | 0.210                |
| BT   | Body-worn | 5.00                      | 3.16                  | 10            | 2.480      | 7.5 | 0.105                |

NOTE: Estimated SAR calculation for BT

## 10. SAR Measurement Results

### 10.1. SAR measurement results

General Notes:

- 1) Per KDB447498 D01, all measurement SAR results are scaled to the maximum tune-up tolerance limit to demonstrate compliant.
- 2) Per KDB447498 D01, testing of other required channels within the operating mode of a frequency band is not required when the reported 1-g or 10-g SAR for the mid-band or highest output power channel is:  $\leq 0.8$  W/kg or  $2.0$  W/kg, for 1-g or 10-g respectively, when the transmission band is  $\leq 100$  MHz. When the maximum output power variation across the required test channels is  $> \frac{1}{2}$  dB, instead of the middle channel, the highest output power channel must be used.
- 3) Per KDB865664 D01, for each frequency band, repeated SAR measurement is required only when the measured SAR is  $\geq 0.8$  W/Kg; if the deviation among the repeated measurement is  $\leq 20\%$ , and the measured SAR  $< 1.45$  W/Kg, only one repeated measurement is required.
- 4) Per KDB941225 D06, the DUT Dimension is bigger than  $9\text{ cm} \times 5\text{ cm}$ , so  $10\text{mm}$  is chosen as the test separation distance for Hotspot mode. When the antenna-to-edge distance is greater than  $2.5\text{cm}$ , such position does not need to be tested.
- 5) Per KDB648474 D04, SAR is evaluated without a headset connected to the device. When the standalone reported Body-Worn SAR is  $\leq 1.2$  W/kg, no additional SAR evaluations using a headset are required.
- 6) Per KDB648474D04, the device is considered a "Phablet" since the diagonal dimension is greater than  $160\text{mm}$  and less than  $200\text{mm}$ . 10-g Extremity SAR tests are required when hotspot mode does not apply or if hotspot 1-g reported SAR  $> 1.2$  W/kg when scaled to the maximum allowed output power tolerance. When hotspot mode applies, 10-g extremity SAR is required only for the surfaces and edges with hotspot mode 1-g reported SAR  $> 1.2$  W/kg. When power reduction applies to hotspot mode the measured SAR must be scaled to the maximum output power, including tolerance, allowed for Phablet modes to compare with the  $1.2$  W/kg SAR test reduction threshold. Simultaneous transmission SAR consideration for 10-g extremity SAR requires consideration only when standalone 10-g SAR is required.
- 7) Per KDB865664 D02, SAR plot is only required for the highest measured SAR in each exposure configuration, wireless mode and frequency band combination; Plots are also required when the measured SAR is  $> 1.5$  W/kg, or  $> 7.0$  W/kg for occupational exposure. The published RF exposure KDB procedures may require additional plots; for example, to support SAR to peak location separation ratio test exclusion and/or volume scan post-processing(Refer to appendix C for details).

### 10.1.1. SAR measurement Result of GSM850

| Test Position of Head | Test channel /Freq. | Test Mode            | SAR Value (W/kg) |       | Power Drift (±5%) | Conducted power (dBm) | Tune-up power (dBm) | Scaled SAR 1g (W/Kg) |

## 10.2. Simultaneous Transmission Possibilities

The Simultaneous Transmission Possibilities of this device are as below:

| No. | Configuration                       | Head | Body - worn | Hotspot | Note           |
|-----|-------------------------------------|------|-------------|---------|----------------|
| 1   | GSM(Voice) + WiFi 2.4GHz(data)      | Yes  | Yes         | N/A     |                |
| 2   | UMTS(Voice) + WiFi 2.4GHz(data)     | Yes  | Yes         | N/A     |                |
| 3   | GSM(Voice) + BT(data)               | Yes  | Yes         | N/A     |                |
| 4   | UMTS(Voice) + BT(data)              | Yes  | Yes         | N/A     |                |
| 5   | GPRS/EDGE(data) + WiFi 2.4GHz(data) | Yes  | Yes         | Yes     | 2.4GHz Hotspot |
| 6   | UMTS(data) + WiFi 2.4GHz(data)      | Yes  | Yes         | Yes     | 2.4GHz Hotspot |
| 7   | GPRS/EDGE(data) + BT(data)          | Yes  | Yes         | Yes     | BT Tethering   |
| 8   | UMTS(data) + BT(data)               | Yes  | Yes         | Yes     | BT Tethering   |

### NOTE:

- 1) This device supported VoIP in GPRS EGPRS and UMTS (e.g. 3rd party VoIP).
- 2) This device WiFi 2.4GHz supports Hotspot operation.
- 3) WiFi 2.4GHz and BT share the same antenna, and cannot transmit simultaneously.
- 4) EUT will choose each GSM or UMTS according to the network signal condition; therefore, they will not operate simultaneously at any moment.
- 5) The Scaled SAR summation is calculated based on the same configuration and test position.

### 10.3. SAR Summation Scenario

Per KDB 447498 D01, simultaneous transmission SAR is compliant if,

- 1) Scalar SAR summation < 1.6W/kg.
- 2)  $SPLSR = (SAR_1 + SAR_2)^{1.5} / (\text{min. separation distance, mm})$ , and the peak separation distance is determined from the square root of  $[(x_1 - x_2)^2 + (y_1 - y_2)^2 + (z_1 - z_2)^2]$ , where  $(x_1, y_1, z_1)$  and  $(x_2, y_2, z_2)$  are the coordinates of the extrapolated peak SAR locations in the zoom scan. If  $SPLSR \leq 0.04$ , simultaneously transmission SAR measurement is not necessary.

| Measurement 6: System Performance Check - SID2450-Body |

### Measurement 1: System Performance Check - SID835-Head

|                      |   |
|----------------------|---|
| Date of measurement: | Aug 10, 2015  |
| Signal:              | Communication System: CW; Frequency: 835.00MHz; Duty Cycle: 1:1.00  |
| ConvF:               | 4.54  |
| Liquid Parameters:   | Relative permittivity (real part): 43.29; Conductivity (S/m): 0.87; |
| Device Position:     | Dipole  |
| Area Scan:           | dx=15mm dy=15mm, h=5.00mm   |
| Zoom Scan:           | 5x5x7, dx=8mm dy=8mm dz=5mm, h=5.00mm                               |

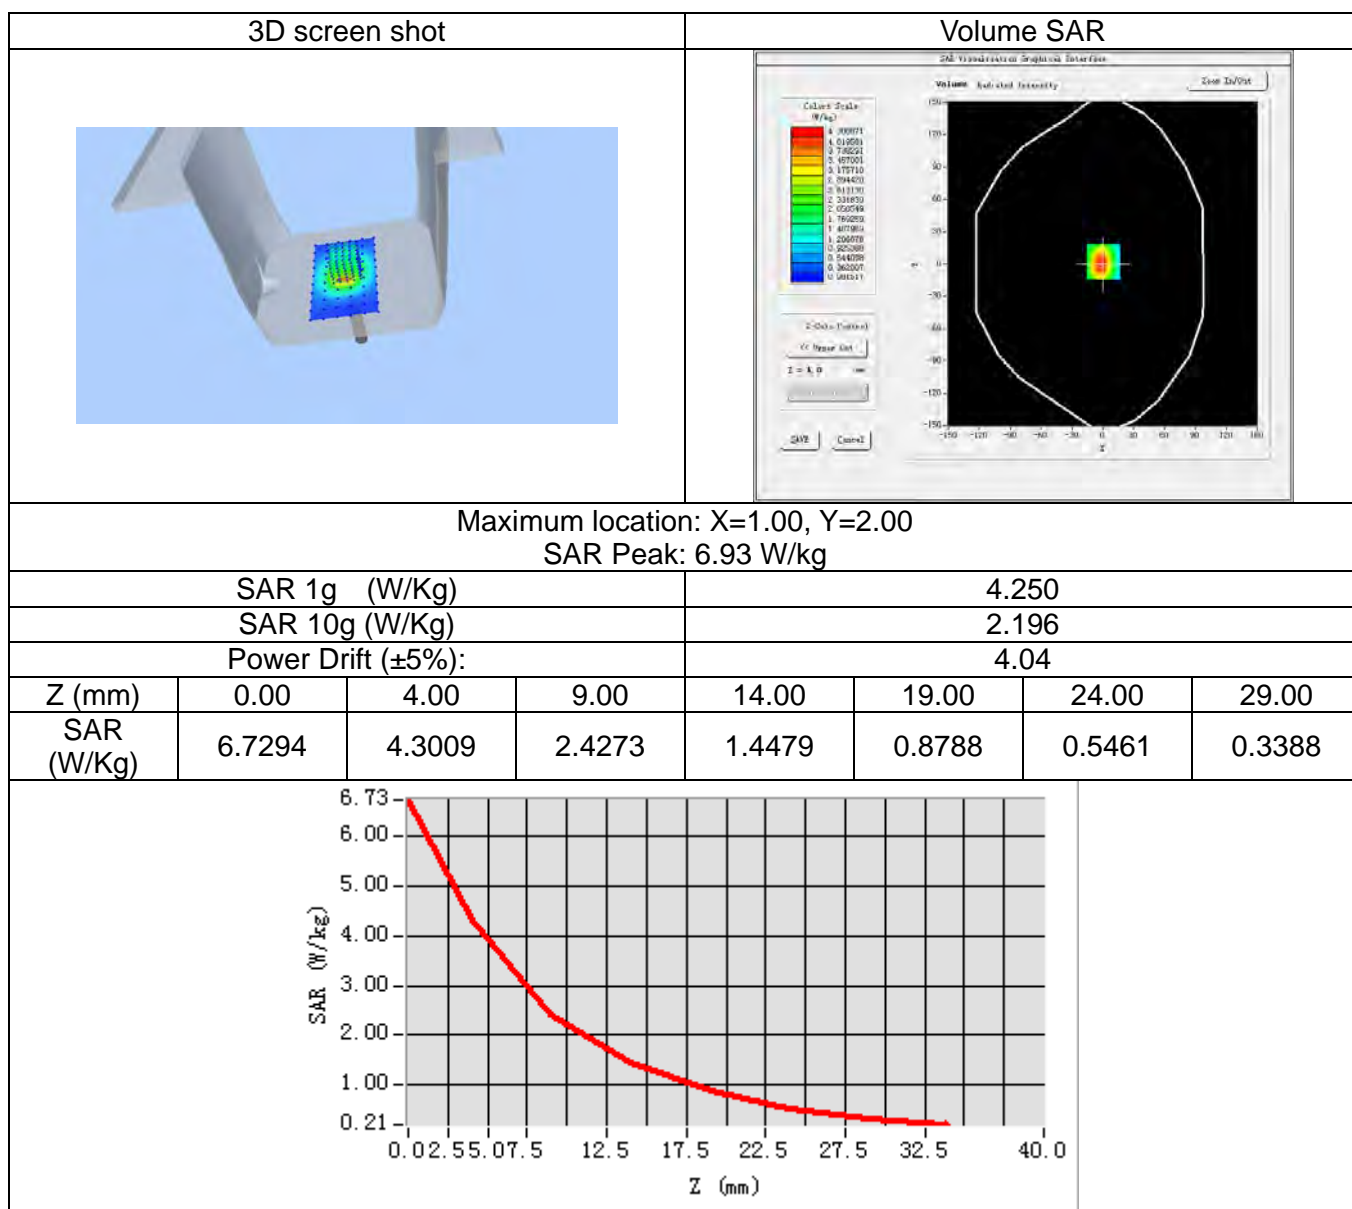

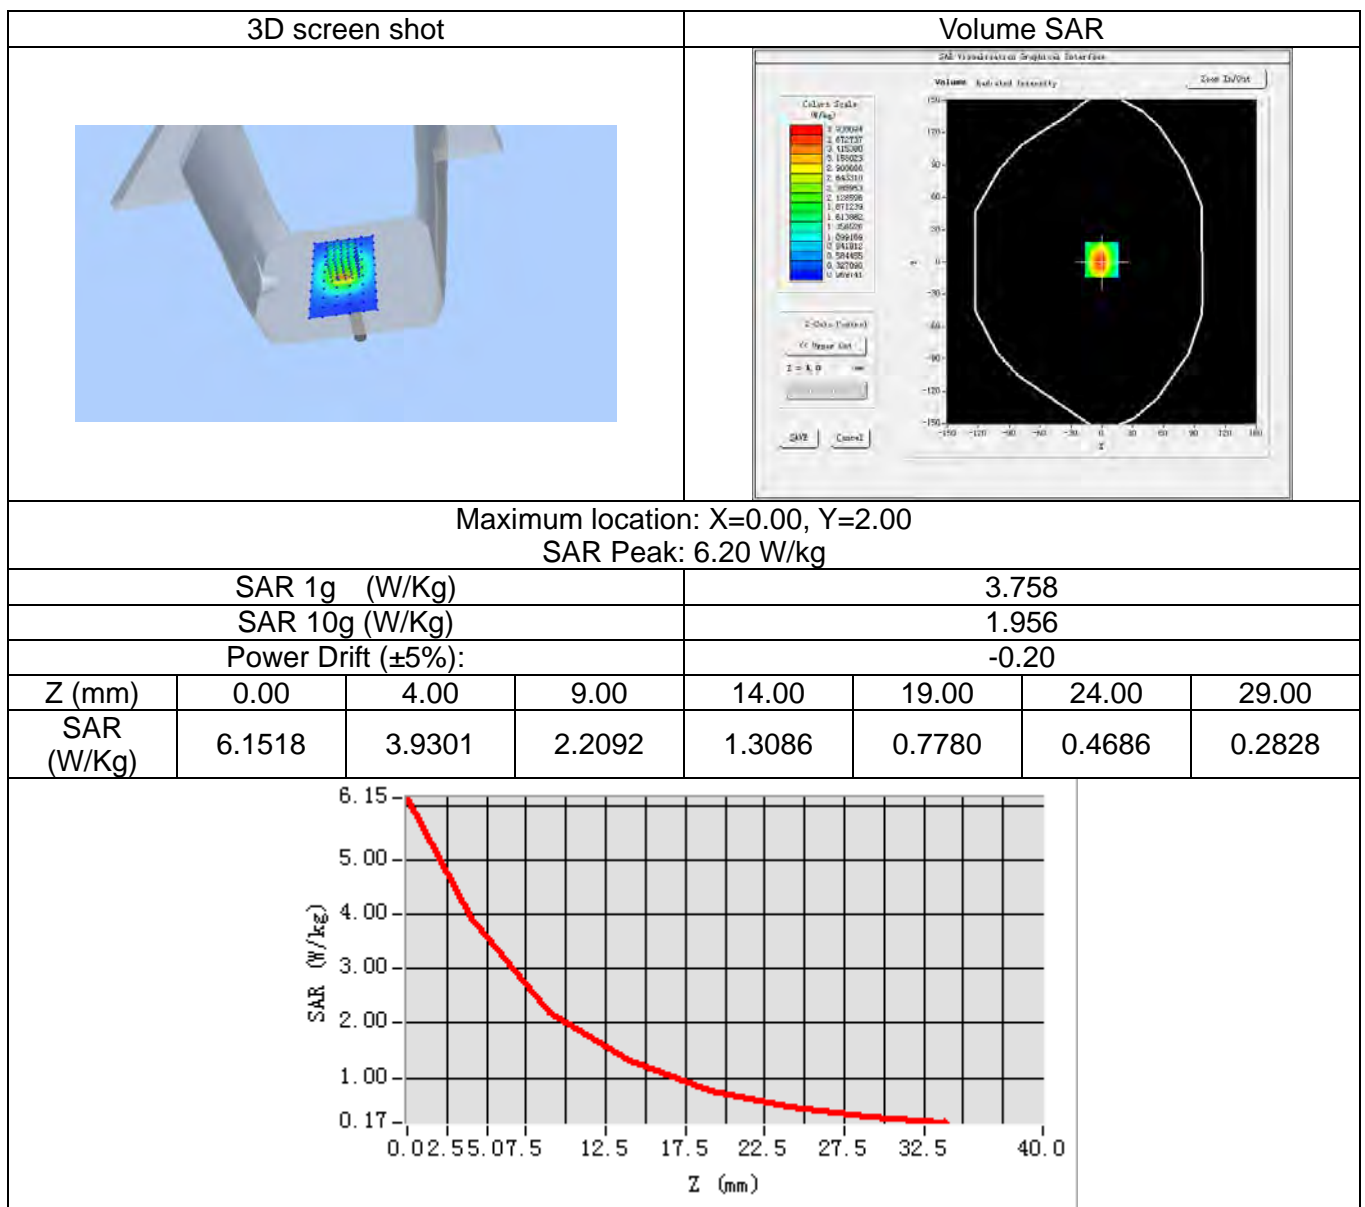

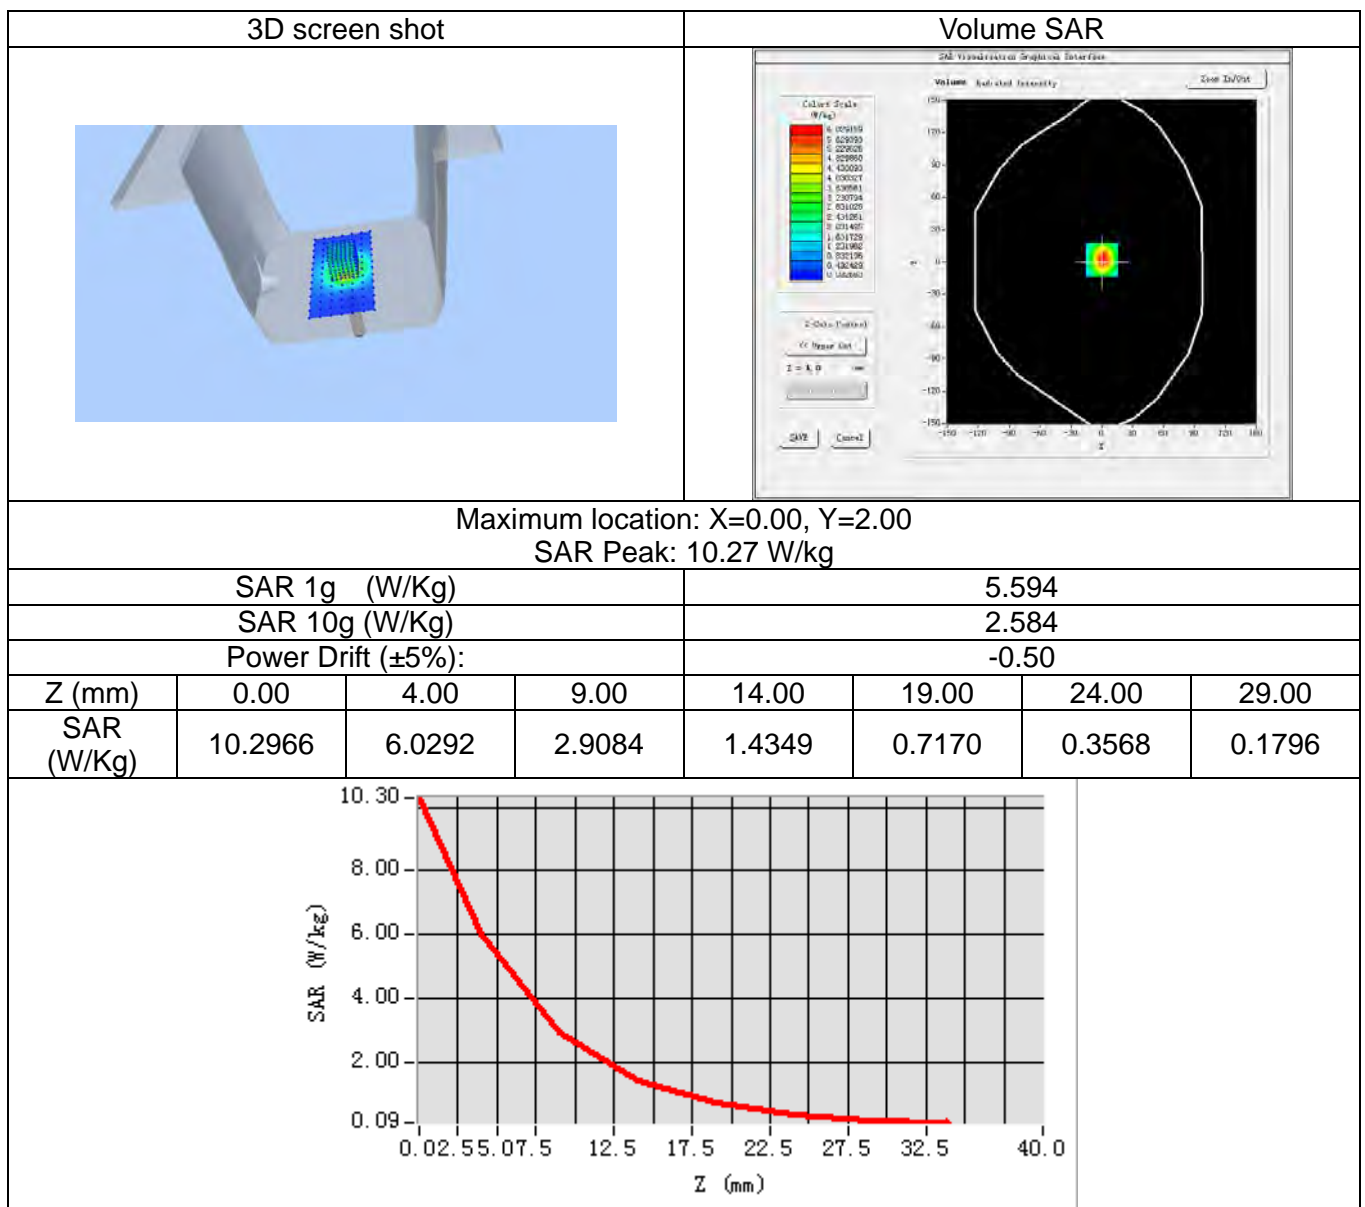

### Measurement 3: System Performance Check - SID1900-Head

|                      |   |
|----------------------|---|
| Date of measurement: | Aug 11, 2015  |
| Signal:              | Communication System: CW; Frequency: 1900.00MHz; Duty Cycle: 1:1.00 |
| ConvF:               | 4.27  |
| Liquid Parameters:   | Relative permittivity (real part): 38.54; Conductivity (S/m): 1.42; |
| Device Position:     | Dipole  |
| Area Scan:           | dx=15mm dy=15mm, h=5.00mm   |
| Zoom Scan:           | 5x5x7, dx=8mm dy=8mm dz=5mm, h=5.00mm                               |

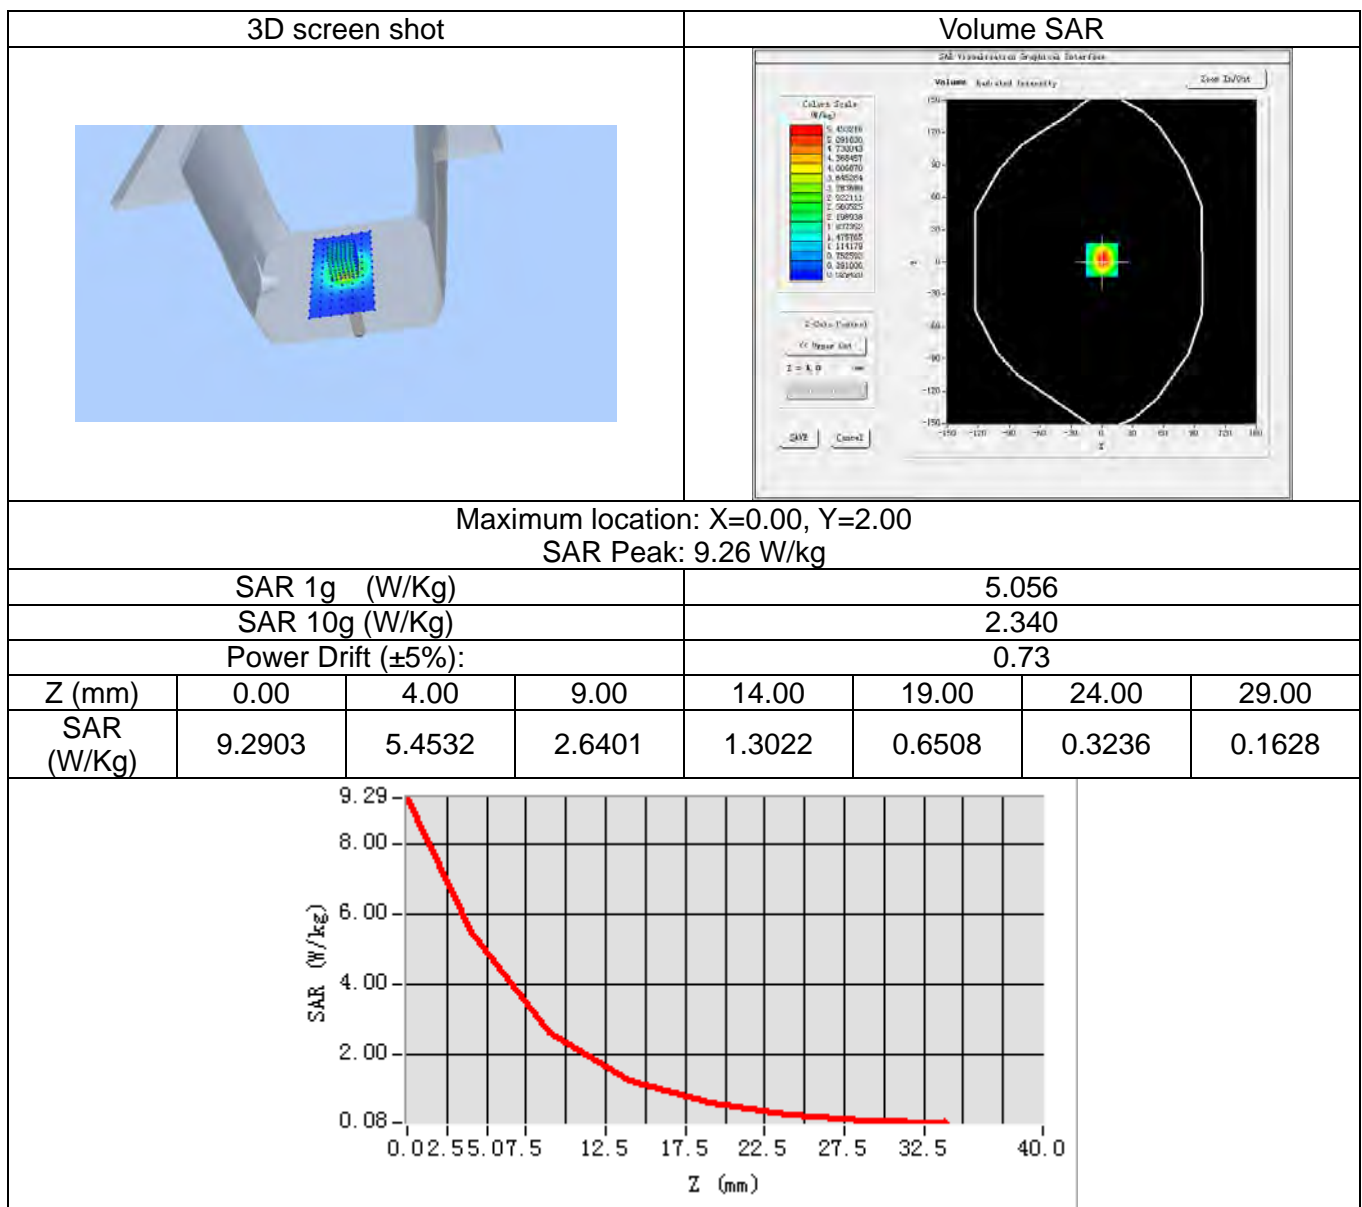

**Measurement 6: System Performance Check - SID2450-Body**

|                      |   |
|----------------------|---|
| Date of measurement: | Aug 12, 2015  |
| Signal:              | Communication System: CW; Frequency: 2450.00MHz; Duty Cycle: 1:1.00 |
| ConvF:               | 3.84  |
| Liquid Parameters:   | Relative permittivity (real part): 51.48; Conductivity (S/m): 1.95; |
| Device Position:     | Dipole  |
| Area Scan:           | dx=12mm dy=12mm, h=5.00mm   |
| Zoom Scan:           | 7x7x7, dx=5mm dy=5mm dz=5mm, h=5.00mm                               |

**BAO'AN DISTRICT, SHENZHEN GUANGDONG, CHINA**  
**MVG COMOSAR DOSIMETRIC E-FIELD PROBE**  
**SERIAL NO.: SN 07/15 EP247**

**Calibrated at MVG US**  
**2105 Barrett Park Dr. - Kennesaw, GA 30144**

**04/06/2015**

### *Summary:*

This document presents the method and results from an accredited COMOSAR Dosimetric E-Field Probe calibration performed in MVG USA using the CALISAR / CALIBAIR test bench, for use with a COMOSAR system only. All calibration results are traceable to national metrology institutions.

## COMOSAR E-FIELD PROBE CALIBRATION REPORT

Ref. ACR.139.1.15.SATU.A

### 1 DEVICE UNDER TEST

| Device Under Test                        |   |
|--|---|
| Device Type                              | COMOSAR DOSIMETRIC E FIELD PROBE  |
| Manufacturer                             | MVG   |
| Model                                    | SSE5  |
| Serial Number                            | SN 07/15 EP247  |
| Product Condition (new / used)           | New   |
| Frequency Range of Probe                 | 0.7 GHz-3GHz  |
| Resistance of Three Dipoles at Connector | Dipole 1: R1=0.181 MΩ<br>Dipole 2: R2=0.167 MΩ<br>Dipole 3: R3=0.175 MΩ |

A yearly calibration interval is recommended.

### 2 PRODUCT DESCRIPTION

#### 2.1 GENERAL INFORMATION

MVG's COMOSAR E field Probes are built in accordance to the IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards.

Figure 1 – MVG COMOSAR Dosimetric E field Dipole

|  |        |
|--|--------|
| Probe Length                               | 330 mm |
| Length of Individual Dipoles               | 4.5 mm |
| Maximum external diameter                  | 8 mm   |
| Probe Tip External Diameter                | 5 mm   |
| Distance between dipoles / probe extremity | 2.7 mm |

### 3 MEASUREMENT METHOD

The IEEE 1528, OET 65 Bulletin C, CENELEC EN50361 and CEI/IEC 62209 standards provide recommended practices for the probe calibrations, including the performance characteristics of interest and methods by which to assess their affect. All calibrations / measurements performed meet the fore mentioned standards.

#### 3.1 LINEARITY

The evaluation of the linearity was done in free space using the waveguide, performing a power sweep to cover the SAR range 0.01W/kg to 100W/kg.

## COMOSAR E-FIELD PROBE CALIBRATION REPORT

Ref. ACR.139.1.15.SATU.A

### 3.2 SENSITIVITY

The sensitivity factors of the three dipoles were determined using a two step calibration method (air and tissue simulating liquid) using waveguides as outlined in the standards.

### 3.3 LOWER DETECTION LIMIT

The lower detection limit was assessed using the same measurement set up as used for the linearity measurement. The required lower detection limit is 10 mW/kg.

### 3.4 ISOTROPY

The axial isotropy was evaluated by exposing the probe to a reference wave from a standard dipole with the dipole mounted under the flat phantom in the test configuration suggested for system validations and checks. The probe was rotated along its main axis from 0 - 360 degrees in 15 degree steps. The hemispherical isotropy is determined by inserting the probe in a thin plastic box filled with tissue-equivalent liquid, with the plastic box illuminated with the fields from a half wave dipole. The dipole is rotated about its axis (0°-180°) in 15° increments. At each step the probe is rotated about its axis (0°-360°).

### 3.5 BOUNDARY EFFECT

The boundary effect is defined as the deviation between the SAR measured data and the expected exponential decay in the liquid when the probe is oriented normal to the interface. To evaluate this effect, the liquid filled flat phantom is exposed to fields from either a reference dipole or waveguide. With the probe normal to the phantom surface, the peak spatial average SAR is measured and compared to the analytical value at the surface.

## 4 MEASUREMENT UNCERTAINTY

The guidelines outlined in the IEEE 1528, OET 65 Bulletin C, CENELEC EN50361 and CEI/IEC 62209 standards were followed to generate the measurement uncertainty associated with an E-field probe calibration using the waveguide technique. All uncertainties listed below represent an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=2, traceable to the Internationally Accepted Guides to Measurement Uncertainty.

| Uncertainty analysis of the probe calibration in waveguide |                       |                          |            |    |                          |
|--|-----------------------|--------------------------|------------|----|--------------------------|
| ERROR SOURCES  | Uncertainty value (%) | Probability Distribution | Divisor    | ci | Standard Uncertainty (%) |
| Incident or forward power                                  | 3.00%                 | Rectangular              | $\sqrt{3}$ | 1  | 1.732%                   |
| Reflected power  | 3.00%                 | Rectangular              | $\sqrt{3}$ | 1  | 1.732%                   |
| Liquid conductivity  | 5.00%                 | Rectangular              | $\sqrt{3}$ | 1  | 2.887%                   |
| Liquid permittivity  | 4.00%                 | Rectangular              | $\sqrt{3}$ | 1  | 2.309%                   |
| Field homogeneity  | 3.00%                 | Rectangular              | $\sqrt{3}$ | 1  | 1.732%                   |

### 1 INTRODUCTION

This document contains a summary of the requirements set forth by the IEEE 1528, FCC KDBs and CEI/IEC 62209 standards for reference dipoles used for SAR measurement system validations and the measurements that were performed to verify that the product complies with the fore mentioned standards.

### 2 DEVICE UNDER TEST

| Device Under Test              |                                  |
|--------------------------------|----------------------------------|
| Device Type                    | COMOSAR 835 MHz REFERENCE DIPOLE |
| Manufacturer                   | MVG                              |
| Model                          | SID835                           |
| Serial Number                  | SN 03/15 DIP 0G835-347           |
| Product Condition (new / used) | New                              |

A yearly calibration interval is recommended.

### 3 PRODUCT DESCRIPTION

#### 3.1 GENERAL INFORMATION

MVG's COMOSAR Validation Dipoles are built in accordance to the IEEE 1528, FCC KDBs and CEI/IEC 62209 standards. The product is designed for use with the COMOSAR test bench only.

## SAR REFERENCE DIPOLE CALIBRATION REPORT

Ref ACR.139.4.15.SATU.A

### 4 MEASUREMENT METHOD

The IEEE 1528, FCC KDBs and CEI/IEC 62209 standards provide requirements for reference dipoles used for system validation measurements. The following measurements were performed to verify that the product complies with the fore mentioned standards.

#### 4.1 RETURN LOSS REQUIREMENTS

The dipole used for SAR system validation measurements and checks must have a return loss of -20 dB or better. The return loss measurement shall be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards.

#### 4.2 MECHANICAL REQUIREMENTS

The IEEE Std. 1528 and CEI/IEC 62209 standards specify the mechanical components and dimensions of the validation dipoles, with the dimensions frequency and phantom shell thickness dependent. The COMOSAR test bench employs a 2 mm phantom shell thickness therefore the dipoles sold for use with the COMOSAR test bench comply with the requirements set forth for a 2 mm phantom shell thickness.

### 5 MEASUREMENT UNCERTAINTY

All uncertainties listed below represent an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of  $k=2$ , traceable to the Internationally Accepted Guides to Measurement Uncertainty.

#### 5.1 RETURN LOSS

The following uncertainties apply to the return loss measurement:

| Frequency band | Expanded Uncertainty on Return Loss |
|----------------|-------------------------------------|
| 400-6000MHz    | 0.1 dB                              |

#### 5.2 DIMENSION MEASUREMENT

The following uncertainties apply to the dimension measurements:

| Length (mm) | Expanded Uncertainty on Length |
|-------------|--------------------------------|
| 3 - 300     | 0.05 mm                        |

#### 5.3 VALIDATION MEASUREMENT

The guidelines outlined in the IEEE 1528, FCC KDBs, CENELEC EN50361 and CEI/IEC 62209 standards were followed to generate the measurement uncertainty for validation measurements.

| Scan Volume | Expanded Uncertainty |
|-------------|----------------------|
|-------------|----------------------|

## 6 CALIBRATION MEASUREMENT RESULTS

### 6.1 RETURN LOSS AND IMPEDANCE IN HEAD LIQUID

| Frequency (MHz) | Return Loss (dB) | Requirement (dB) | Impedance                   |
|-----------------|------------------|------------------|-----------------------------|
| 835             | -30.94           | -20              | $52.6 \Omega + 1.1 j\Omega$ |

### 6.2 RETURN LOSS AND IMPEDANCE IN BODY LIQUID

| Frequency (MHz) | Return Loss (dB) | Requirement (dB) | Impedance                   |
|-----------------|------------------|------------------|-----------------------------|
| 835             | -25.76           | -20              | $47.7 \Omega + 4.6 j\Omega$ |

### 6.3 MECHANICAL DIMENSIONS

| Frequency MHz | L mm     |          | h mm     |          | d mm     |          |
|---------------|----------|----------|----------|----------|----------|----------|
|               | required | measured | required | measured | required | measured |

## 7 VALIDATION MEASUREMENT

The IEEE Std. 1528, FCC KDBs and CEI/IEC 62209 standards state that the system validation measurements must be performed using a reference dipole meeting the fore mentioned return loss and mechanical dimension requirements. The validation measurement must be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards. Per the standards, the dipole shall be positioned below the bottom of the phantom, with the dipole length centered and parallel to the longest dimension of the flat phantom, with the top surface of the dipole at the described distance from the bottom surface of the phantom.

### 7.1 HEAD LIQUID MEASUREMENT

| Frequency<br>MHz | Relative permittivity ( $\epsilon_r'$ ) |          | Conductivity ( $\sigma$ ) S/m |          |
|------------------|---|----------|-------------------------------|----------|
|                  | required                                | measured | required                      | measured |
| 300              | 45.3 ±5 %                               |          | 0.87 ±5 %                     |          |
| 450              | 43.5 ±5 %                               |          | 0.87 ±5 %                     |          |
| 750              | 41.9 ±5 %                               |          | 0.89 ±5 %                     |          |
| 835              | 41.5 ±5 %                               | PASS     | 0.90 ±5 %                     | PASS     |
| 900              | 41.5 ±5 %                               |          | 0.97 ±5 %                     |          |
| 1450             | 40.5 ±5 %                               |          | 1.20 ±5 %                     |          |
| 1500             | 40.4 ±5 %                               |          | 1.23 ±5 %                     |          |
| 1640             | 40.2 ±5 %                               |          | 1.31 ±5 %                     |          |

## 7.2 SAR MEASUREMENT RESULT WITH HEAD LIQUID

The IEEE Std. 1528 and CEI/IEC 62209 standards state that the system validation measurements should produce the SAR values shown below (for phantom thickness of 2 mm), within the uncertainty for the system validation. All SAR values are normalized to 1 W forward power. In bracket, the measured SAR is given with the used input power.

|   |  |
|---|--|
| Software                                  | OPENSAR V4   |

## SAR REFERENCE DIPOLE CALIBRATION REPORT

Ref. ACR.139.7.15.SATU.A

### 1 INTRODUCTION

This document contains a summary of the requirements set forth by the IEEE 1528, FCC KDBs and CEI/IEC 62209 standards for reference dipoles used for SAR measurement system validations and the measurements that were performed to verify that the product complies with the fore mentioned standards.

### 2 DEVICE UNDER TEST

| Device Under Test              |                                   |
|--------------------------------|-----------------------------------|
| Device Type                    | COMOSAR 1900 MHz REFERENCE DIPOLE |
| Manufacturer                   | MVG                               |
| Model                          | SID1900                           |
| Serial Number                  | SN 03/15 DIP 1G900-350            |
| Product Condition (new / used) | New                               |

A yearly calibration interval is recommended.

### 3 PRODUCT DESCRIPTION

#### 3.1 GENERAL INFORMATION

MVG's COMOSAR Validation Dipoles are built in accordance to the IEEE 1528, FCC KDBs and CEI/IEC 62209 standards. The product is designed for use with the COMOSAR test bench only.

**Figure 1 – MVG COMOSAR Validation Dipole**

## SAR REFERENCE DIPOLE CALIBRATION REPORT

Ref: ACR.139.7.15.SATU.A

### 4 MEASUREMENT METHOD

The IEEE 1528, FCC KDBs and CEI/IEC 62209 standards provide requirements for reference dipoles used for system validation measurements. The following measurements were performed to verify that the product complies with the fore mentioned standards.

#### 4.1 RETURN LOSS REQUIREMENTS

The dipole used for SAR system validation measurements and checks must have a return loss of -20 dB or better. The return loss measurement shall be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards.

#### 4.2 MECHANICAL REQUIREMENTS

The IEEE Std. 1528 and CEI/IEC 62209 standards specify the mechanical components and dimensions of the validation dipoles, with the dimensions frequency and phantom shell thickness dependent. The COMOSAR test bench employs a 2 mm phantom shell thickness therefore the dipoles sold for use with the COMOSAR test bench comply with the requirements set forth for a 2 mm phantom shell thickness.

### 5 MEASUREMENT UNCERTAINTY

All uncertainties listed below represent an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of  $k=2$ , traceable to the Internationally Accepted Guides to Measurement Uncertainty.

#### 5.1 RETURN LOSS

The following uncertainties apply to the return loss measurement:

| Frequency band | Expanded Uncertainty on Return Loss |
|----------------|-------------------------------------|
| 400-6000MHz    | 0.1 dB                              |

#### 5.2 DIMENSION MEASUREMENT

The following uncertainties apply to the dimension measurements:

| Length (mm) | Expanded Uncertainty on Length |
|-------------|--------------------------------|
| 3 - 300     | 0.05 mm                        |

#### 5.3 VALIDATION MEASUREMENT

The guidelines outlined in the IEEE 1528, FCC KDBs, CENELEC EN50361 and CEI/IEC 62209 standards were followed to generate the measurement uncertainty for validation measurements.

| Scan Volume | Expanded Uncertainty |
|-------------|----------------------|
| 1 g         | 20.3 %               |

## 7 VALIDATION MEASUREMENT

The IEEE Std. 1528, FCC KDBs and CEI/IEC 62209 standards state that the system validation measurements must be performed using a reference dipole meeting the fore mentioned return loss and mechanical dimension requirements. The validation measurement must be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards. Per the standards, the dipole shall be positioned below the bottom of the phantom, with the dipole length centered and parallel to the longest dimension of the flat phantom, with the top surface of the dipole at the described distance from the bottom surface of the phantom.

### 7.1 HEAD LIQUID MEASUREMENT

| Frequency<br>MHz | Relative permittivity ( $\epsilon_r'$ ) |          | Conductivity ( $\sigma$ ) S/m |          |
|------------------|---|----------|-------------------------------|----------|
|                  | required                                | measured | required                      | measured |
| 300              | 45.3 ±5 %                               |          | 0.87 ±5 %                     |          |
| 450              | 43.5 ±5 %                               |          | 0.87 ±5 %                     |          |

## 7.2 SAR MEASUREMENT RESULT WITH HEAD LIQUID

The IEEE Std. 1528 and CEI/IEC 62209 standards state that the system validation measurements should produce the SAR values shown below (for phantom thickness of 2 mm), within the uncertainty for the system validation. All SAR values are normalized to 1 W forward power. In bracket, the measured SAR is given with the used input power.

## SAR REFERENCE DIPOLE CALIBRATION REPORT

Ref: ACR.139.9.15.SATU.A

### 1 INTRODUCTION

This document contains a summary of the requirements set forth by the IEEE 1528, FCC KDBs and CEI/IEC 62209 standards for reference dipoles used for SAR measurement system validations and the measurements that were performed to verify that the product complies with the fore mentioned standards.

### 2 DEVICE UNDER TEST

| Device Under Test              |                                   |
|--------------------------------|-----------------------------------|
| Device Type                    | COMOSAR 2450 MHz REFERENCE DIPOLE |
| Manufacturer                   | MVG                               |
| Model                          | SID2450                           |
| Serial Number                  | SN 03/15 DIP 2G450-352            |
| Product Condition (new / used) | New                               |

A yearly calibration interval is recommended.

### 3 PRODUCT DESCRIPTION

#### 3.1 GENERAL INFORMATION

MVG's COMOSAR Validation Dipoles are built in accordance to the IEEE 1528, FCC KDBs and CEI/IEC 62209 standards. The product is designed for use with the COMOSAR test bench only.

**Figure 1 – MVG COMOSAR Validation Dipole**

## SAR REFERENCE DIPOLE CALIBRATION REPORT

Ref. ACR.139.9.15.SATU.A

### 4 MEASUREMENT METHOD

The IEEE 1528, FCC KDBs and CEI/IEC 62209 standards provide requirements for reference dipoles used for system validation measurements. The following measurements were performed to verify that the product complies with the fore mentioned standards.

#### 4.1 RETURN LOSS REQUIREMENTS

The dipole used for SAR system validation measurements and checks must have a return loss of -20 dB or better. The return loss measurement shall be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards.

#### 4.2 MECHANICAL REQUIREMENTS

The IEEE Std. 1528 and CEI/IEC 62209 standards specify the mechanical components and dimensions of the validation dipoles, with the dimensions frequency and phantom shell thickness dependent. The COMOSAR test bench employs a 2 mm phantom shell thickness therefore the dipoles sold for use with the COMOSAR test bench comply with the requirements set forth for a 2 mm phantom shell thickness.

### 5 MEASUREMENT UNCERTAINTY

All uncertainties listed below represent an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of  $k=2$ , traceable to the Internationally Accepted Guides to Measurement Uncertainty.

#### 5.1 RETURN LOSS

The following uncertainties apply to the return loss measurement:

| Frequency band | Expanded Uncertainty on Return Loss |
|----------------|-------------------------------------|
| 400-6000MHz    | 0.1 dB                              |

#### 5.2 DIMENSION MEASUREMENT

The following uncertainties apply to the dimension measurements:

| Length (mm) | Expanded Uncertainty on Length |
|-------------|--------------------------------|
| 3 - 300     | 0.05 mm                        |

#### 5.3 VALIDATION MEASUREMENT

The guidelines outlined in the IEEE 1528, FCC KDBs, CENELEC EN50361 and CEI/IEC 62209 standards were followed to generate the measurement uncertainty for validation measurements.

| Scan Volume | Expanded Uncertainty |
|-------------|----------------------|
| 1 g         | 20.3 %               |

## 7 VALIDATION MEASUREMENT

The IEEE Std. 1528, FCC KDBs and CEI/IEC 62209 standards state that the system validation measurements must be performed using a reference dipole meeting the fore mentioned return loss and mechanical dimension requirements. The validation measurement must be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards. Per the standards, the dipole shall be positioned below the bottom of the phantom, with the dipole length centered and parallel to the longest dimension of the flat phantom, with the top surface of the dipole at the described distance from the bottom surface of the phantom.

### 7.1 HEAD LIQUID MEASUREMENT

| Frequency<br>MHz | Relative permittivity ( $\epsilon_r'$ ) |          | Conductivity ( $\sigma$ ) S/m |          |
|------------------|---|----------|-------------------------------|----------|
|                  | required                                | measured | required                      | measured |
| 300              | 45.3 ±5 %                               |          | 0.87 ±5 %                     |          |
| 450              | 43.5 ±5 %                               |          | 0.87 ±5 %                     |          |
| 750              | 41.9 ±5 %                               |          | 0.89 ±5 %                     |          |
| 835              | 41.5 ±5 %                               |          | 0.90 ±5 %                     |          |
| 900              | 41.5 ±5 %                               |          | 0.97 ±5 %                     |          |
| 1450             | 40.5 ±5 %                               |          | 1.20 ±5 %                     |          |
| 1500             | 40.4 ±5 %                               |          | 1.23 ±5 %                     |          |
| 1640             | 40.2 ±5 %                               |          | 1.31 ±5 %                     |          |
| 1750             | 40.1 ±5 %                               |          | 1.37 ±5 %                     |          |

### 7.2 SAR MEASUREMENT RESULT WITH HEAD LIQUID

The IEEE Std. 1528 and CEI/IEC 62209 standards state that the system validation measurements should produce the SAR values shown below (for phantom thickness of 2 mm), within the uncertainty for the system validation. All SAR values are normalized to 1 W forward power. In bracket, the measured SAR is given with the used input power.

|   |  |
